5. Selection Description

1. Service Factor

Gear units are designed under the circumstance of steady load, stated operating time per day and a few sarting times. But the practical condition will be not as perfect as the designed circumstance. So we must confirm driven machine factor f_{B1}, prime mover factor f_{B2}, starting factor f_{B3} according to actual load type, operating time, starting frequency. Let it less than or equale to the servicefactor fe of selection table, viz $ff_{B1}xf_{B2}xf_{B3} \leqslant f_B$. The needed torque of service machine multiply theservice factor ($f_{B1}xf_{B2}xf_{B3}$) should less than or equale to gear units' permissible torque.

$M_a \geqslant M_d x f_{B1} x f_{B2} x f_{B3}$

f_{B1}-driven machine factor(see table 1)
f_{B2}-prime mover factor(see table 2)
f_{B3}-starting factor(see table 3)
M_d-the needed torque of driven machine
M_a-gear units' permissible torque

Please understand the following at first in order to select the model of JRESSD、JRESND worm gear reducer properly:

- Load condition.
- Speed scope orratio in application.
- Working condition and environment.
- Installation space

Define working condition Coefficient

- Ensure machinery load types A, B, C according to table 1.
- Get the working condition coefficient K1 from diagram 1 according to turning time (hour/day) and startfrequency(times/hour).
- Inspect working condition and select coefficient

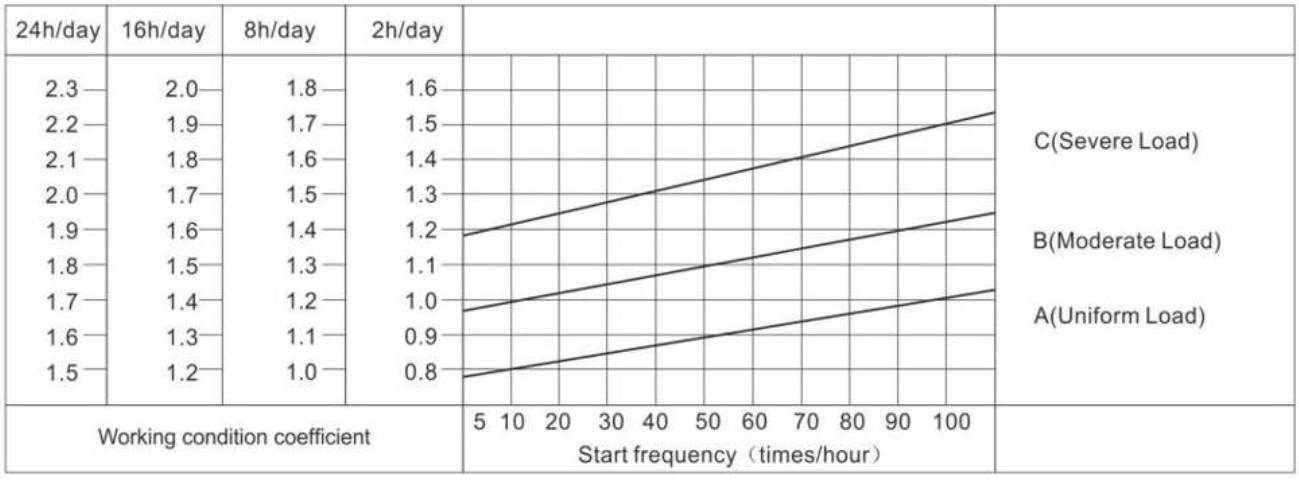

Table 1 Machinery load classification selection

Using situation	Example	Load type
Uniform load	Convey band(uniform conveying)	A(Uniform load)
Moderate Load	Speed changed conveying	B(Moderate load)
Severe Load	Compressor、pulverizer, etc.	C(Severe load)

Table 2 Working condition coefficient

Ambient temperature	Working condition coefficient
-10℃~ 30℃	1
30℃ ~ 40℃	1.1 ~ 1.2

Diagram 1 working condition coefficient

Reducer selected

- At first it is better to make sure the value of input machinery load T(torgue) and then you can get the output torque through T muitiply with work situation coefficient K1 and work situation revise coefficent K2 .The reguired model can be gained by the above and connecting ratio or output speed.

- You can also select the reducer as followings:calculate output torgue according to known input power and then select the reducer in accordance with output torque and rotate speed.
- Our standard reducers all have right-hand helical tooth,deciding the rotating direction of input shaft and output shaft according to the rigtht-hand criterion.

2. Overhung and Axial loads

Determining overhung load

When determining the overhung load, the type of transmission element mounted onthe shaft end must be comsidered. The transmission element factors f_z are listed as follows.

Transmission element	Transmission element factor fz	Comments
Gears	1.15	<17teeth
Chain sprockets	1.40	<13teeth
Chain sprockets	1.25	<20teeth
Narrow V-belt pulleys	1.75	Pre-tensioning influence
Flat belt pulleys	2.50	Pre-tensioning influence
Toothed belt pulleys	2.5	Pre-tensioning influence

The overhung load exerted on the motor or gear shaft is then calculated as follows:

$$F_R = \frac{M_d \cdot 2000}{d_o} \cdot f_z$$

F_R Overhung load in N

M_d Torque in Nm

d_o Mean diameter of the mounted transmission element in mm

f_z Transmission element factor

Permitted overhung load

According the rate service life L_{H10} of the anti-friction bearings to define the permitted overhung l -oads.

For the special operating conditions, the permitted overhung loads can be determined by the mo -dified service life L_{na} .

The permitted overhung loads F_{Ra} for the output shafts of foot-mounted gear units with a sold sh-aft are listed in the selection tables for geared motors.Please contact JIE in case of other types.

The data refer to the radial force acting midway on the shaft end (with right-angle gear units on the A-side output).Worst case conditions have been assumed for the force application angle α an -d the direction of rotation.

Higher appproved overhung loads

It possible to achieve a higher overhung load by exactly considering the force application ang -le α and the direction of rotation.In addition,higger output shaft loads are permitted if heavy duty bearings are installed,especially with JRESR,JRESK gear units.Please contact JIE in this case.

Definition of force application

Force application is defined according to the following diagram:

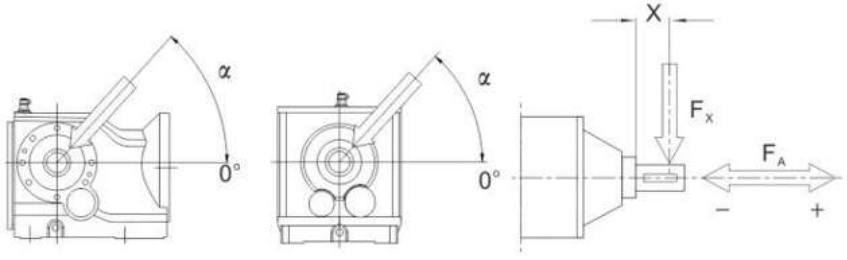

Fig: Definition of force application

F_X= Approved overhung load at point X [N]

F_A= Approved axial load [N]

Approved axial loads

If there is no overhung load,then an axial load FA(tension or compression) amountion to 50% of the overhung load given in the selection tables is approved.This applies to the following geare -d motors:

- Helical geared motors
- Parallel shaft and helical bevel geared motors with solid shaft

Overhung load conversion for off-center force application

The approved overhung loads given in the selection tables must be calculated using the follo -wing formulae in the event of force application not in the center of the shaft e-nd. The smaller of the two values F_{XL} (according to bearing service life) and F_{XW} (according to shaft strength)is the approved value for the overhung load at point x. Note that the calculations apply to $M_{a\,max}$.

F_{XL} acc.to bearing service life $\quad F_{XL} = F_{ra} \cdot \frac{a}{b+x}$ [N]

F_{XW} from the shaft strength $\quad F_{XW} = \frac{c}{f+x}$ [N]

F_{Ra} = Approved overhung load(x=1/2) for foot-mounted gear units according to the selection tables in [N]

X = Distance from the shaft shoulder to the force application point in [mm]

a,b,f = Gear unit constants for overhung liad conversion [mm]

c = Gear unit constant for overhung load conversion [Nmm]

3. Examples for Model Chosen

Ex1 Bucket conveyors
Required torque:100Nm
Speed:About 55r/min
Environment temperature:indoor 20℃
Turning time:12hour/day
Start frequency:5times/hour

Customer demand：Direct connection between reducer and motor ,Requirement JRESR type.Install the sprocket on the output shaft,the diameter of the sprocket indexing circle is 100mm,25teeth,the radial force acting on the sprocket is at the midpoint of the shaft extension.

f_{B1}=1.5； f_{B2}=1.0； f_{B3}=1.0；

According to Table 1、Table 2、Table 3,Bucket conveyors, > 10hour/day,working machine coefficient f_{B1}=1.5,f_{B2}=1.0,f_{B3}=1.0.

Calculate the allowable torque of the gear motor

$M_a \geq M_d \times f_{B1} \times f_{B2} \times f_{B3}$=100 × 1.5 × 1.0 × 1.0=150Nm,can choose the closest gear motor.

Choose model:JRESR37SS80M2-4P-0.75-24.42

Input power:0.75kW,Output speed 57r/min,Output torque 127Nm.

Verify radial and axial loads

Calculate formula based on radial force $F_R = \frac{M_d \cdot 2000}{d_0} \cdot f_z = \frac{100 \cdot 2000}{100} \cdot 1.25 = 2500N$,the allowable radial force of the gear motor is 4320N, meet requirement.

EX2 Covey band(moderate load)

Torque:65N m
Speed:About 21r/min
Ratio:1/60
Turning time:16 hours/day
Start frequency:100 times/hour
Environment temperature:indoor 35℃
Connect with motor directly

- As per load classification table 1 :moderate load,choose B;
- As per cross point of 100 times/hours frequency on line B in diagram 1,get coefficient K1 valer is 1.65 that turni -ng time is 16 hours/day;

Get the coefficient K2 1.15 according to table 2;

So the torque value is 65Nm.You can select the model that torque value is the closest to 123 Nm.

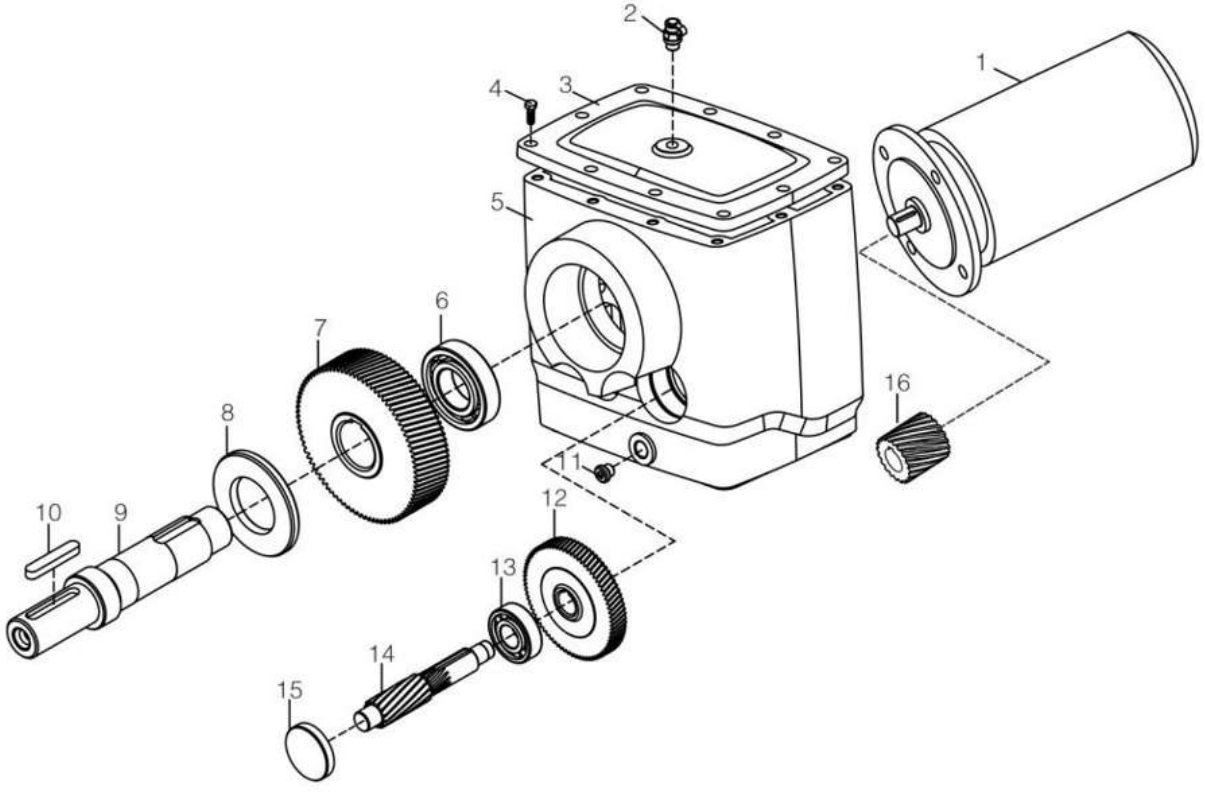

Choose model:JRESSD63-1/60

Input power is 0.55 kW, output speed is 23.3r/min,output torque is 140N m;

You can get the actual output torque through the nominal output torque 140N m mutiply with the coefficient fs 0.9,so the actual output is 126Nm＞123Nm.The selected model is suitable for use.
